ABSTRACT

A needle device having a plurality of needles with applied tips arranged so as to define a plurality of contact edges. In one embodiment one or more oblique edges is provided relative to an intermediate horizontal edge or a plurality of oblique edges with adjacent edges sharing a common needle point vertex. The number and needle grading (e.g., fine/sharper tips; medium and heavy grades) are represented by the different contact edges of the needle device. The number of each needle sub-sets is also preferably varied to provide enhanced flexibility as the application as in cosmetic tattooing. A tool for supporting is also preferably provided as in a reciprocating needle device support is provided. The needle device is particularly well suited for providing permanent eye liner makeup in view of its adaptability to accommodate different skin textures and skin surface presentations.
